Abstract (en)

Formworks for concrete floors or beams to be cast are in practice supported by vertically adjustable, temporary structures (1). These are mostly comprised of system parts, to wit posts, beams and diagonals, in which the upper part of the posts (4) is mostly embodied as telescoping inner pipe and outer pipe with screw spindle (5) for enabling a large height adjustment. The invention relates to a receiving member (14) for an optimum bearing of main beams and stabilization of the top of said structure.
