Abstract (en)
[origin: EP2080861A1] The stop has an anchoring rod (1) with an end at which a blocking element (2) is mounted. Adjustable stop (3) has an opening hole (3b) and cooperates with units formed by a bush for ensuring translational immobility of the stop (3) in a spaced position determined with respect to the element. The bush is mounted on the rod and engaged in the hole. The bush has a tapered bearing (5b) and a threaded bearing (5c) emerging in the hole for cooperating with a nut (6) to ensure tightening of the bearing (5b) relative to the rod corresponding to immobilization of the stop, under a locking effect.
