Abstract (en)
[origin: WO2008068125A1] The invention relates to a roller mill comprising at least one grinding roller and a rotatable grinding plate, which are arranged in an inner space of the mill, and also a force arm which is held pivotably and in a rotationally fixed manner in a bearing, wherein the grinding roller is mounted such that it can rotate on an end of the force arm, and there are also provided means for exerting a force on the force arm that comprise a pressure cylinder which is in operative contact with the force arm, in order to adjust the grinding pressure exerted by the grinding roller. The contact point at which the force of the pressure cylinder is transmitted to the force arm is in this case situated outside the inner space of the mill.
