Abstract (en)
[origin: WO2008044132A2] A blocking device (1) including a striker (5) in the form of a striker plate (5) sliding perpendicularly to the door (2) and adapted to cooperate in use with a notch (3) of the door (2), and a safety device (6) including a catch (7) blocking the sliding of the striker (5) and control means (8) including electrically operated actuating means (10) for selectively moving the catch (7) between an extracted position and a retracted position from/into its seat (11) in the safety device, in which positions the catch (7) is adapted to respectively intercept/not intercept the striker (5); wherein the control means (8) include a first element (12) actuated by the actuator means so as to be mobile between a first and a second limit stop positions in a direction (P) perpendicular to that of movement (S) of the catch (7); and a bell crank (14) restrained so as to be oscillating on a plane parallel to direction (S) of movement of the catch (7), operatively connected with its first shorter arm (15) to the first element and with its second longer arm (16) to the catch, to receive from the first element (12) an oscillating movement so to shift the catch (7) between said extracted and retracted positions in response to a movement of the first element (12) between said second and first limit stop positions.
