Abstract (en)

[origin: WO2008037713A1] The present invention relates to a device comprising at least one stabilized projectile (200, 300) housing an active element (210, 310) designed to generate a controlled technical effect over a trajectory, aerodynamic means (230, 330) that can be deployed between a rest retracted position in storage and deployed operational position over the trajectory, and safety means (224, 234) inserted between an initiation means (228, 280) and the active element (210, 310) to prevent the latter from being initiated until after the aerodynamic means (230, 330) have been deployed.
