Abstract (en)

[origin: WO2008060467A2] A method for accessing content is provided. In the method, information from a first memory device is retrieved. A parameter is generated based on the information and an account on a second memory device is accessed based on the parameter. The second memory device is configured to store the content and the account is associated with the content. The first and second memory devices are configured to be removably coupled to a computing device. A memory device is also provided comprising a memory and a memory controller. The memory controller is configured to encrypt information stored in the memory to define a parameter and access an account on a second memory device based on the parameter to gain access to content. The content is stored in the second memory device and the memory device and the second memory device are configured to be removably coupled to a computing device.
