Abstract (en)

[origin: EP2082786A1] The device has a holder, in which a component comprising an exerciser is movably supported in rotary degrees of freedom. A two-armed bifurcated holding element e.g. semicircular arch, is centrally supported at one-side in the holder, and is rotationally movable about a longitudinal axis. Polygonal or gymwheel-type frame constructions (3, 3') e.g. octagonal component, have two bearing journals at outer sides of the constructions and lying on a common middle line. The frame constructions are supported between arms of the holding element in a rotationally movable manner.
