Abstract (en)
[origin: WO2008046477A1] The arrangement relates to an arrangement (11) having a hollow plate (1), for example a honeycomb plate, and a connecting fitting (6). For stable fastening, the invention proposes to insert the connecting fitting (6) through a hole in a covering plate (3) of the hollow plate (1) into a countersunk depression on the inner side of the other covering plate (4) of the hollow plate (1). As a result, the connecting fitting (6) is supported in a stable manner against forces in the radial direction, that is to say against forces which act in the plate plane. For example, a clamping eccentric (19) which is known per se and by way of which a tie rod (14) can be clamped by rotation can be inserted into the connecting fitting (6).
