Abstract (en)

[origin: DE102006051418A1] The method involves inserting a program module into an intelligent document. The program module is developed such that to produce a representable indication of a result of a checking step for checking the availability of a precondition within the intelligent document, where the checking step is implemented by the program module. It is examined whether a program execution environment is available in the checking step. The program module is formed to convert an indication of the negative result of the checking step into a representable indication of a positive result of the checking step. Independent claims are also included for the following: (1) a computer program product with computer program for implementing a method for producing an intelligent document (2) an intelligent document with a program (3) a device for producing an intelligent document.
