Abstract (en)

[origin: EP2085152A1] The method involves passing flat objects through a sorting system with output devices (AE). Identifications of target points are determined during passing of the objects. The objects are distributed on the output devices during passing, by the system such that the system passes out each object in the respective output devices, which are assigned to the target points. The objects are combined to a stack, where the objects of the stack are provided with the identifications and are partially overlapped. The stack is transported to one of the output devices and is passed-out in the output device. An independent claim is also included for a sorting system for sorting flat objects, including output devices.
