Abstract (en)

[origin: EP2085287A1] The method involves activating a warning device of a railway vehicle based on warning parameters. A set of identification information are sent from transmitting devices (Bm-1, Bm, Bm+1) and received by a receiving device (15) that is attached to the vehicle. The set of identification information are transferred to an evaluation device (60) that determines a relative position of the vehicle based on the received identification information. One of the warning parameters that are assigned to the relative position is determined and set for activation of the warning device. An independent claim is also included for a system for automatically determining and setting warning parameters in railway vehicles.
