Abstract (en)

[origin: EP2085342A2] The method involves rotating a material web roll (5) while winding. The oscillation state of the material web roll is indirectly monitored. A variable indirectly characterizing an oscillation direction of the material web roll is directly or indirectly determined. The material course role in a winding device (1) supports two axially parallel arranged bearer drums (2.1,2.2). An independent claim is included for a winding device for rolling a material course of a material course role in form of a winding role.
