Abstract (en)

[origin: EP2085343A1] A paper splicing method for a printing press and a reel stand unit that prevents misregistration at a paper-splicing section in the top-to-bottom direction and that enables improvement of printing quality and stable printing are provided. Provided is a printing press including a reel stand unit (1) configured to bond a web (7) fed out from an old reel (10A) to a new reel (10B) and continuously feed paper by splicing paper from the old reel (10A) to the new reel (10B), wherein the distance (tail length L) in the length direction of an overlapping section of the old reel (10A) and the new reel (10B) spliced by the reel stand unit (1) is smaller than the minimum distance between driving rollers provided in the printing press. The driving rollers are, in particular, the distance between a printing unit (3) and a blanket cylinder (24).
