Abstract (en)

[origin: EP1801333A1] The invention relates to a locking assembly for a ventilating window having a sash arranged to be openable with respect to a main frame by pivotal movement about a pivot axis parallel to a pair of opposed sash members. The locking assembly comprises a strike plate secured to the main frame member and a casing secured to the sash member opposite the strike plate. At least one pawl member is arranged in the casing to be movable between a locking position, in which it is in locking engagement with a stationary locking member of the strike plate, and an unlocked position, in which it is released from said locking engagement. A locking control mechanism controls the movement of the pawl member(s) and is operable by an operator member accessible from the inside of the window via at least one actuator slide. According to the invention the locking assembly comprises a first and a second part where at least one of these first and second parts are moveable in relation to the other and where at least one of these parts is provided with a liner preventing direct contact the first and second parts or is made from a non-metallic material such as plastic.
