Abstract (en)

[origin: EP2085693A2] The method involves performing primary combustion i.e. reciprocating grate burning, of a fuel in a combustion chamber (1) with a grate (3). Secondary combustion i.e. cyclone combustion, is performed in a cyclone chamber (5) with a vertical axis (7), where the combustion chamber and the cyclone chamber are in connection with each other by a connection opening (15). A nozzle is led into the cyclone chamber for admitting air into the cyclone chamber, where the air is supplied in a tangential flow into the cyclone chamber. The cyclone chamber is arranged above the combustion chamber. An independent claim is also included for a device for performing a method of combustion solid fuel.
