Abstract (en)

[origin: WO2008058959A1] This invention relates to a system and a method for managing remote devices adapted for placement on one or more objects, where at least one of the remote devices is adapted to measure at least one or exert at least one object characteristic. A command initiates an action command to be executed simultaneously at the remote devices, and a transmitter for transmitting the action command to a master base device, which forwards the action commands to the remote devices. The remote devices comprise receivers tuned to a single and common frequency channel, and the forwarding to the remote devices is performed via the single common frequency channel.
