Abstract (en)

[origin: WO2008052751A1] The invention relates to a dental device for automatically filling a mouthwash vessel (2), comprising a supply device (7), a holding fixture (3) for the mouthwash vessel (2), said fixture being rotationally mounted about an essentially horizontal axis (4), and a sensor element (12) for detecting a rotating position of the holding fixture (3) or a rotational movement in relation to the axis (4). When a predefined value of the rotating position or the rotating torque is attained, the flow stops flowing through the supply device. At least two different positions (A, B) for said mouthwash vessel (5) can be adjusted and/or marked on the holding fixture (3), said two positions (A, B) being different in their distances to the axis (4).
