Abstract (en)

[origin: WO2008043371A1] The invention relates to a thread feeder (3) that is optimised both in terms of the thread course and in terms of maintenance. Said feeder has a minimum number of thread guide elements and an optimum arrangement of the latter. This permits threads to be guided with the least possible friction, even thin or sensitive threads and affords the best possible access to the drive belt, when the latter needs to be changed.
