Abstract (en)

[origin: WO2008064913A1] The invention relates to a smart card connector or a chip card contact-making device (10) with a contact carrier (12), which is equipped with contacts and on which a cover (14), which is used for pressing the chip card (card) against the upper side of the contact carrier (12), is used for accommodating the card, which cover is preferably capable of being longitudinally displaced out of a cover opening position into a folded-shut position (closing position) and from this position into a card-reading position or end latching position, wherein latching or locking means (41; 86, 87) are provided which latch the cover (14) which has been pivoted into the folded-shut position and therefore define a prelatching position.
