Abstract (en)

[origin: EP2087802A2] The protective helmets (7 to 11) are equipped with a transponder (1). Each transponder is assigned to an identification number characterized for the helmet carrier. The identification number is transferred to a receiver. Each transponder stays in data connection with multiple measuring sensors. The transponder transmits a transmitting frequency as wireless radio wave to a mobile or stationary transmitting and receiving unit arranged outside the application area of the helmet carrier. An independent claim is included for a method for wireless protection monitoring of human values, e.g. temperature, pulse, humidity, shock effect and other values.
