Abstract (en)  
[origin: EP2088244A1] The method involves connecting longitudinal carriers (1) and cross beams (2) to a support grid by grouting, and hardening the grouting. Prefabricated plate elements (4) are positioned on flanks, and are fixed on the support grid by filling of in-situ concrete (5). The support grid is prepared outside of its installation position, and is subsequently placed in the installation position. The cross beams are assembled on upper sides of the longitudinal carriers. The in-situ concrete is applied up to height of upper sides of the cross beams. An independent claim is also included for a system for preparing a steel-concrete composite structure.
