Abstract (en)

[origin: WO2008068416A2] On a traditional pivoting-hinged lid (1) comprised of a lower element (2) and a cap (3), in one of these elements, a recessed handle is provided (32). The recessed handle (32) is covered by an integrity warranty (4). The integrity warranty (4) is configured as a plate (44), and theoretical breaking hasps (5) are formed at its lateral ends (43), which almost open on the edge area of the recessed handle (32). The theoretical breaking hasps (5) thus extend crosswise in the direction of travel of the pivoting-hinged lid in this area. Thus, very short integrity warranty elements can be obtained, which do not pivot and leave the locked state in the warranty position, and without breakage of the theoretical breaking hasps (5). <0}
