Abstract (en)

[origin: EP2090709A1] The present inventions relates to a system (1) for supporting a ceiling along a surface (4), comprising a rail (2) and at least two connecting means (9). The rail (2) has a profile (3) adapted to support at least one tile (100), and the connecting means (9) is adapted to engage the rail (2) and connect the rail (2) to the surface (4). Each connecting means (9) further comprises a resilient element (6) adapted to act on the rail (2) with a force in a first direction in relation to the surface (4), and a setting element (5) adapted to act on the rail (2) with a force in a second direction, opposite the first direction, the connecting means (9) allowing an adjustment of a distance between the surface (4) and the rail (2). The present invention further relates to a method for mounting a system for supporting a ceiling along a surface.
