Abstract (en)
[origin: EP2090763A1] The circuit has a cooling liquid releasing case (3) for receiving cooling liquid e.g. water, from an internal combustion engine (2). A secondary channel (10) transfers the liquid from the case to the engine. A radiator (7) receives the liquid from the case. A temperature sensor (4) is placed in the case, and a thermostatic valve (5) blocks a cooling liquid flow between the case and the radiator. A deflector is placed in the case, and guides the flow until the channel. The sensor and the valve are placed in the liquid flow. The valve is opened, when the liquid attains set point temperature.
