Abstract (en)

[origin: EP2091051A1] The device has a connection unit formed of external clamp (5) and annular clamp, to connect a container (1) and an enclosure, respectively. An integration unit formed of peripheral clamp (9), fixed mold (12), movable mold (15) and central mold integrates a lid (2) and a door (16) of the container and enclosure, respectively. The mold (15) of predefined shape provided on the door cooperates with the fixed mold situated on the lid, where the fixed mold has a shape complementary to that of the movable mold. A lock (25) prevents disintegration of the container and enclosure when the door is open.
