Abstract (en)

[origin: WO2008066456A1] A device for putting on a shoe cover on a shoe, comprising a bar (20) and an expanding holder (24) for a shoe cover (50) at one end of the bar, the shoe cover comprising a bag (50) having a neck that is tightened by an elastic string (51), which extends around at least a part of the circumference of the bag neck. A stand (10) having a guide (14), which guides the bar (20) to a generally vertical axial motion. Biasing members (30, 32, 35) are provided to bias the bar against an upper end position in which the clamping holder (24), that is mounted at the lower end of the bar (20), is lifted up from a substratum (1) for the stand (10) to a level that enables a user to conveniently mount the shoe cover (50) on the holder (24). The bar is displaceable against the action of the biasing device to a lower state at which the holder having mounted shoe cover is situated at the floor.
