Abstract (en)  
[origin: WO2008087317A2] The invention relates to a peripheral security device (10) adapted to be physically connected to a host terminal (14) having at least one driver software (16) installed thereon for establishing a communication between said host terminal and a peripheral device with a human interface (13). The security peripheral device includes a micro-processor (12) for sending security data to the terminal during a communication with said terminal. It is characterised in that the communication between the security peripheral device and the host terminal is managed at the terminal through the driver software, and in that it simulates a communication between the peripheral device with a human interface and the host terminal.
