Abstract (en)

[origin: WO2008056974A1] Method and network unit (10) for determining a measure of relevancy between two selected items of a plurality of interrelated items. The plurality of interrelated items are modeled as nodes ($N_{1\ldots 4}$) in a network, and a relation between two items as an impedance (Z_{ij}) between two associated nodes, in which the impedance (Z_{ij}) is a function of the relevancy between the two items. Furthermore, the impedance value between two nodes (N_l , N_2) associated with the two selected items is determined, and from that, the measure of relevancy is determined as a function of the impedance value between the two nodes (N_1 , N_2).
