Abstract (en)

[origin: WO2008067998A2] The aim of the invention is to simplify the design and evaluation of sensor elements (20a) of an operating device (11). For this purpose, the sensor elements are configured in such a manner as to have differently sized subsurfaces (22a, 24a, 26a). When a finger is placed on a cover (13) above the sensor element (20a) according to the print (15, 16) provided thereon, a contact surface is created above the sensor element (20a). By means of this contact surface a differently sized operating signal is triggered which can then be associated with a corresponding operation function.
