Abstract (en)
[origin: EP2093299A1] The invention concerns an apparatus (1) for fur processing which performs an automated removal of all flesh and fat residue from the skin side of a fur (2). The apparatus includes an elongated tapering mandrel (3) upon which the fur is drawn with the fur side facing inwards and with the head end (6) of the fur at the thinnest end (7) of the mandrel, where the fur is scraped by at least one roller scraper unit (8), which is peculiar in that the roller scraper unit is furthermore adapted with at least one secondary scraper roller (16) which during rotation is adapted to transmit a tangential friction force to the fur on the mandrel in a direction towards the thinnest end of the mandrel. Hereby is achieved that the roller scraper unit in a single operation can perform both primary and secondary scraping, where primary scraping removes the immediately accessible flesh and fat from the skin side, and secondary scraping loosens all the flesh and fat located under the forelegs on the fur.
