Abstract (en)

[origin: WO2008076010A1] The present invention deals with an arrangement for carrying a hand-held motor-driven tool on a harness having at least one shoulder strap. The arrangement comprises: a hip pad (20) arranged for connection to a harness (10), the hip pad having a principal surface (21); a hook (24) for receiving a tool; and a clamp (25) for connecting the hook (24) to the hip pad (20), the clamp being arranged at an attachment area (23) of the hip pad, and the clamp being openable such that the hook (24) can be released from the clamp (25). The hook (24) is further connected to the clamp (25) such that it is limited to be movable in a plane that is substantially perpendicular to said principal surface (21) at the attachment area (23) of the hip pad. Thereby, no sliding movement will occur between the hip pad and the hook or the tool, resulting in less wear of the hip pad and the tool.
