Abstract (en)

[origin: FR2911015A1] The method involves distributing power request between a main energy storing device and a secondary energy storing device, when an electric supply receives a solicitation in electric power. A charge state of the main energy storing device is measured, and an electric energy exchange is stored between the main and the secondary energy storing device from the measurement. Power is distributed by fixing a limitation threshold for power. An independent claim is also included for a device for implementing an energetic flow management method.
