Abstract (en)

[origin: US2010064740A1] A door lock includes a door catch system for double door-type helicopter doors that can, when being closed, additionally be displaced perpendicularly to the plane of the door opening into the closed position (flush fitting). The door lock includes a catch element (30) associated with the latch element (31) and actively linked therewith, the catch element maintaining the door 'caught' directly in front of its locked position when the door is manually closed until the door is translated to its final closed position via the latch element (31).
