Abstract (en)
[origin: CA2666566A1] Solids distributor for injection plants, in particular for blast furnaces , comprising a chamber and a plurality of lance lines (90) which lead off, w herein the chamber has a supply connection (77) for a ground solid which is to be distributed. According to the invention, the chamber is a collecting chamber (72) enclosed by a common wall (73), with the result that the lance lines (90) connected to it are interconnected within the collecting chamber (72), wherein a pressure container (4) is arranged geodetically above the collecting chamber (72), the lower part of which container is designed as a bunker (42) and has an outlet (47) connected to the supply connection (77), and the upper part (41) of which container is designed as a gas space. The design of the chamber as a common collecting chamber (72) and the direct connection of the lance lines (90) to the common wall (73) provide a significantly better raw distribution, which means that the individual lance controls conventionally used are largely superfluous. The invention extends to a corresponding distributor head which is particularly suitable for retrofitting existing plants.
