Abstract (en)

[origin: FR2910652A1] The module has a printed circuit board for electrical circuits, and electrical connecting pads (3, 5) carried by a surface of the board. Each pad is connected to an associated electric track of the board such that each pad follows a position on the board. A surface connecting element (23) is elastically deformable, and connected to ground. The connecting element covers the surface of the board such that a support of a finger on the connecting element connects the pads with the ground at the level of the support so as to determine position of the support. The surface connecting element is made of metal, and has a conductive material layer e.g. skin made of conductive particle charged elastomer such as silicone, or conductive polymer.
