Abstract (en)

[origin: WO2008065026A1] In a fault-current circuit breaker or residual-current circuit breaker a test button (16, 16') is arranged in the pivoting region of the handle (14), which can be used to switch the circuit breaker on and off. Said test button is in particular arranged in such a way that it is at least partially hidden from the operator by the handle (14) in the OFF position of the handle (14), in which case it is not necessary for it to be capable of being actuated. As a result of this compact design, space for labelling on a control surface (12) of the fault-current circuit breaker (10) is provided.
