Abstract (en)
[origin: EP2096654A1] The housing (1) has a sliding switch comprising a sliding element (3) that partially projects through an opening (4). A flank (5) is provided on both sides of the opening parallel to the movement direction of the sliding switch. The flank is provided for a lateral protection of the sliding switch against an inadvertent operation. The flank exhibits a wedge-shaped catch mechanism, which limits switching of the flank between two adjoin positions. The catch mechanism is movably designed so that the catch mechanism is switched to a position.
