Abstract (en)

[origin: WO2008049854A1] The invention relates to a foaming device for the measured output of a small amount of foam which results from the mixture of air (11,13) with a foamable medium (7, 9), in particular a foam for personal or other care or cleaning. Air and the foamable medium are turned into foam by means of a foaming chamber (4). To make the foaming of the dose dispenser especially efficient, controllable, and usable for the most varied foamable media, the invention provides that flow bars (16) in the foaming chamber extend within the foaming chamber and intermesh with each other while forming a foaming channel (17) in the shape of a flow labyrinth.
