Abstract (en)
[origin: US2008155756A1] A method and apparatus for delivering and transferring a liquid fabric treating composition to saturated clothing within a clothes washing machine during the course of a laundering operation comprises operating the washing machine in the conventional fashion to perform a washing cycle and a rinse cycle. A liquid fabric treating composition is introduced into the washing machine with the saturated clothing after completion of the rinse cycle but in advance of the spin cycle. The liquid fabric treating composition and the saturated clothing are tumbled together so that an effective amount of the liquid fabric treating composition may be transferred to the clothing as a result of contact of the liquid fabric treating composition with water that is contained in the clothing after completion of the rinse cycle. The spin cycle is then initiated, after which time the clothing may be removed from the washing machine for drying.
