Abstract (en)

[origin: WO2008061793A1] The invention relates to the control of air traffic management at an airport, wherein optimized partial process sequences for the flight visit of an individual airplane can be determined with an electronic data processing system. An air-to-air process for the coordination of the movements of airplanes at the airport and a gate-to-gate process for the control of long-distance flights, including take-off and approach phase, are coupled in said method.
