Abstract (en)

[origin: EP2098312A1] A laminated steel sheet used as a raw material has a tensile strength TS after forming at an equivalent strain seq of 1.6 is 800 MPa or less and satisfies $0.25 \# \# tb / to$ where tb is a sheet thickness at a fracture surface after fracture and to is a sheet thickness before the fracture. In forming the laminated steel sheets, forming is conducted so as to satisfy the relationships below: $1.5 \# \# h / R \# \# r_2, 2.8 \# \# R / r_1, a \# \# n \# \# d_1.1 \# \# r_2 / r_1$ where h: a height from a can bottom to an opening edge portion; r: an outer diameter of a can body; R: a radius of a circular blank before forming having a weight equivalent to a weight of a final formed can body; r₁ : an outer radius of an opening edge portion; and r₂ : an outer radius of a bead portion.
