Abstract (en)

The invention relates to an element for stacking hollow objects, such as beakers (30) and like containers, arranged one partially internally of another. The element comprises a tray (10) having such a shape as to be keyable on an external surface of an extreme lower portion of each object located internally of another object, and also comprises a flank (11) which defines a relatively soft spacer that prevents direct contact between the external surface of an internal object of the objects and the internal surface of an external object of the objects.
