Abstract (en)

[origin: EP2098809A1] The element (110) has a casing (112) provided with a heat transfer wall (122) to interchange thermal energy with goods i.e. medicament, to be refrigerated. A fluid space (120) is adjacent to the wall, and a storage space (118) is separated from the fluid space by a separating element (114). The storage space is arranged such that a supply of cooling agent (126) e.g. parafme, is kept away from the fluid space in a solid aggregation condition. The cooling agent is transferred from the storage space into the fluid space in a fluid aggregation condition. Independent claims are also included for the following: (1) a cooling container comprising an outer container with a receiver for spatial fixing of a cooling element (2) a method for cooling goods to be refrigerated (3) a method for manufacturing a cooling element.
