Abstract (en)

[origin: EP2101026A2] The method involves modulating a query signal on another signal for switching an operating mode of a sensor unit between an active mode and an inactive mode of the sensor unit. The latter signal is forwarded to the sensor unit. The forwarded latter signal is evaluated (S1) based on switching the sensor unit between an active mode and an inactive mode. An independent claim is included for a device for controlling a door operation of a swing door.
