Abstract (en)  
[origin: EP2101105A1] The device has a code headlight producing a light beam with a cut-off, and a complementary headlight (3) combined with the cut-off light beam to produce a route beam when the headlight (3) is ignited. The headlight (3) is constituted by a light source formed by a LED (7), a lens (9) and a mirror (13) that recovers a part of a luminous flux of the source. The lens is non-stigmatic and generates a large beam corresponding to a light band at a low cut-off with a reduced height while the mirror provides light in a central zone, above the band of the lens.
