Abstract (en)  
[origin: WO2008074507A1] The invention relates to a frequency decoupling device of a first part relative to a second part, said device including an outer rigid frame (1) to be connected with the first part and an inner rigid frame (2) provided inside said outer frame and to be connected with the second part, an elastically deformable member (3, 4, 10) being provided between said frames so as to define at least one liquid-containing annular chamber (5) between said frames, said device being characterised in that said chamber has an inner perimeter =  $P_{int}$ , an average height =  $H$  = on said perimeter and an average thickness =  $E$  = on said perimeter, wherein the average thickness  $E$  corresponds to the following condition (I), the inner perimeter =  $P_{int}$ , the average height =  $H$  = and the average thickness =  $E$  = being in millimetres.
