Abstract (en)  
[origin: WO2008077576A1] In order to create a rotary furnace burner, wherein the proportion of inexpensive lumpy secondary fuels (25) to be used as an energy source can be increased, and the configuration of the burner flame can be influenced even during burner operation, the invention proposes to provide an expansion chamber (21) that is open toward the burner orifice in front of the discharge hole/holes of the pipes in order to blow out of the secondary fuels in the burner, wherein the chamber compared to the individual pipe or pipes has an expanded cross-section, and to vary the axial length and the volume of the expansion chamber (21) by axial displacement (22) of the secondary fuel pipes (19, 20) during burner operation such that the lumpy secondary fuel particles blown out at the burner orifice with considerably reduced speed do not pass the burner flame, but instead burn off in the flame.
