Abstract (en)

[origin: EP2103485A2] A real-image picking-up means (2,4,6) picks up a real image of a blind area. A moving object detecting means recognizes a moving object from the real image and detects a moving state of the moving object. An imaginary-image specifying means specifies an indication manner of an imaginary image which is to be indicated for showing the moving state of the moving object. An indicating means (14) indicates the imaginary image of the moving object in the indication manner which is specified by the imaginary-image specifying means such that the imaginary image of the moving object indicated by the indicating means overlaps the real image picked up by the real-image picking-up means. There can be provided a surroundings monitoring device for a vehicle which can easily recognize the state of the moving object in the image of the blind area.
