Abstract (en)

[origin: EP2105383A1] The machine has a chamber with a cover (5), which is liftable from a lowered position into a lifted position, where the chamber is closed in the lowered position and opened in the lifted position. The cover is pivotable in the lifted position. The cover is pivotable around a joint (7), which is provided at a cross-beam (8). A lifting device (6) is provided for lifting and lowering the cover. The cover is connected to the joint in such a manner that a rotation axis of the joint runs through a center of gravity of the cover. An auxiliary device is provided for pivoting the cover.
