Abstract (en)

[origin: EP2107022A1] The device has a slowing member (1) i.e. brush, extended to a trajectory of sheets to a receiving station, where the slowing member is movable between two limit positions. A driving device is operable for moving the slowing member between the positions. The driving device comprises a linear cam (4) pivoted about a transverse shaft (2), a roller (7) positioned for rolling along a surface of the cam, and a pneumatic actuator operable to pivot the linear cam. A support (8) is pivoted about another transverse shaft, where the roller and the member are supported by the support.
